# SQL – Data Definition Language

Carla Teixeira Lopes

Bases de Dados Mestrado Integrado em Engenharia Informática e Computação, FEUP

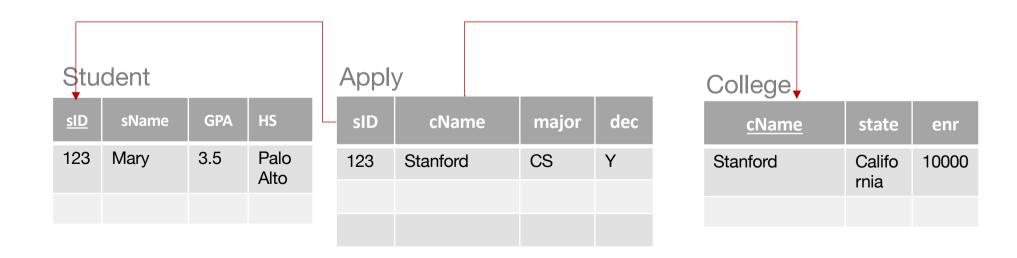

# Referential Integrity

Integrity of references

No "dangling pointers"

Referential integrity from R.A to S.B

Each value in column A of table R must appear in column B of table S

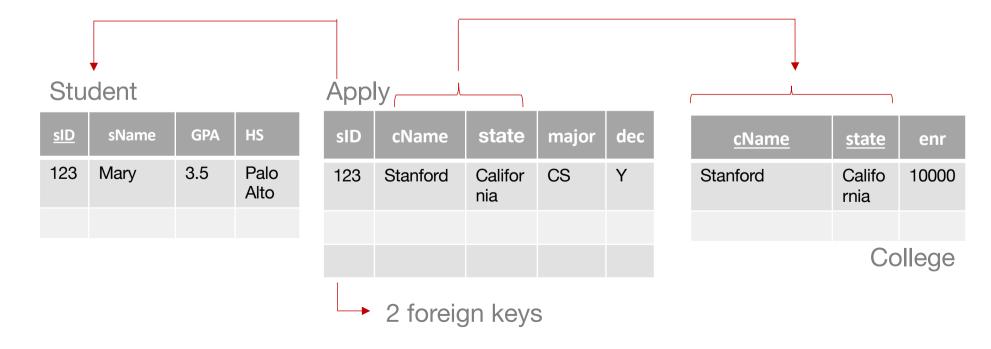

# Referential Integrity

### Referential integrity from R.A to S.B

A is called the "foreign key"

B is usually required to be the primary key for table S or at least unique

Multi-attribute foreign keys are allowed

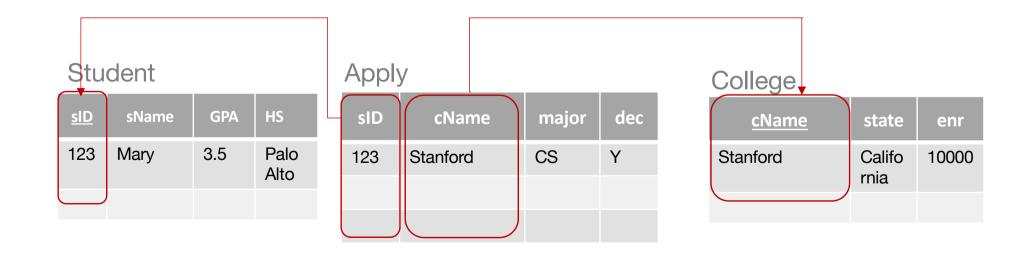

# Referential Integrity Enforcement (R.A to S.B)

### Potentially violating modifications

Insert into R
Delete from S
Update R.A
Update S.B

If violation -> error

Depends on Foreign key definition

# Referential Integrity Enforcement (R.A to S.B)

### Delete from S

Restrict (default)

Generate an error, modification disallowed

Set Null

Replace R.A by NULL

Cascade

Delete tuples having a referencing value

### Student

<u>sID</u>	sName	GPA	HS
123	Mary	3.5	Palo Alto
234	Louis	3.8	Palo Alto

### Apply

sID	cName	major	dec
NEBL	Stanford	CS	Υ
234	MIT	CS	Υ

### College

<u>cName</u>	state	enr
Stanford	Califo rnia	10000
MIT	Mass achus etts	15000

# Referential Integrity Enforcement (R.A to S.B)

### Update S.B

Restrict (default)

Generate an error, modification disallowed

Set Null

Replace R.A by NULL

Cascade

Do the same update to R.A

### Student

	<u>sID</u>	sName	GPA	HS
	123	Mary	3.5	Palo Alto
/	/			

### **Apply**

sID	cName	major	dec
NEGL		CS	Υ
234	Standford MIT	CS	Υ

### College

<u>cName</u>	state	enr
Stanford Standford	Califo rnia	10000

# Foreign Key Declaration

```
CREATE TABLE < table_A> (
  <column_A> <data_type> PRIMARY KEY,
  <column_B> <data_type>,
  <column_C> <data_type>
);
CREATE TABLE <table_B> (
  <column_X> <data_type> PRIMARY KEY,
  <column_Y> <data_type>,
  <column_Z> <data_type> REFERENCES <table_A>(<column_A>)
```

**CREATE TABLE** College (cName text **PRIMARY KEY**, state text, enrollment int);

**CREATE TABLE** Student (sID int **PRIMARY KEY**, sName text, GPA real, sizeHS int);

```
CREATE TABLE Apply (
sID REFERENCES Student(sID),
cName text REFERENCES College(cName),
major text,
decision text,
PRIMARY KEY(sID, cName)
);
```

# Foreign Key to Primary Key

If the referenced column is the primary key of the other table, we can omit the name of the column

**CREATE TABLE** College (cName text **PRIMARY KEY**, state text, enrollment int);

**CREATE TABLE** Student (sID int **PRIMARY KEY**, sName text, GPA real, sizeHS int);

```
create table Apply (
slD int references Student,
cName text references College,
major text,
decision text,
PRIMARY KEY(slD, cName)
);
```

# Multiple Column Foreign Key Declaration

```
CREATE TABLE < table_A> (
   <column A> <data type>,
   <column B> <data type>,
   <column C> <data type>,
   PRIMARY KEY (<column_A>, <column_B>)
);
CREATE TABLE < table_B> (
 <column X> <data type> PRIMARY KEY,
 <column Y> <data type>,
 <column Z> <data type>,
 FOREIGN KEY (<column_X>, <column_Y>) REFERENCES <table_A>(<column_A>, <column_B>)
);
```

```
CREATE TABLE College (cName text, state text, enrollment int, PRIMARY KEY (cName, state));
```

CREATE TABLE Student (sID int PRIMARY KEY, sName text, GPA real, sizeHS int);

```
CREATE TABLE Apply (
sID REFERENCES Student,
collegeName text,
collegeState text,
major text,
decision text,
FOREIGN KEY (collegeName, collegeState) REFERENCES College(cName, state),
PRIMARY KEY(sID, collegeName, collegeState)
);
```

We can omit the referenced columns if they are primary keys

# On Delete and On Update Actions

Define actions that take place when deleting or modifying parent key values.

Use the ON DELETE and ON UPDATE clauses with one of the values:

### RESTRICT

prohibit operation on a parent key when there are child keys mapped to it

### SET DEFAULT

child key columns are set to the default value

### **SET NULL**

child key columns are set to NULL

### CASCADE

propagates the operation on the parent key to each dependent child key

```
CREATE TABLE College (cName text PRIMARY KEY, state text, enrollment int);
CREATE TABLE Student (sID int PRIMARY KEY, sName text, GPA real, sizeHS int);
CREATE TABLE Apply (
    sID REFERENCES Student(ID),
    cName text REFERENCES College (cName) ON DELETE SET NULL ON
    UPDATE CASCADE,
    major text,
    decision text,
    PRIMARY KEY(sID, cName)
);
```

# Enabling Foreign Key Support in SQLite

Foreign key constraints are disabled by default

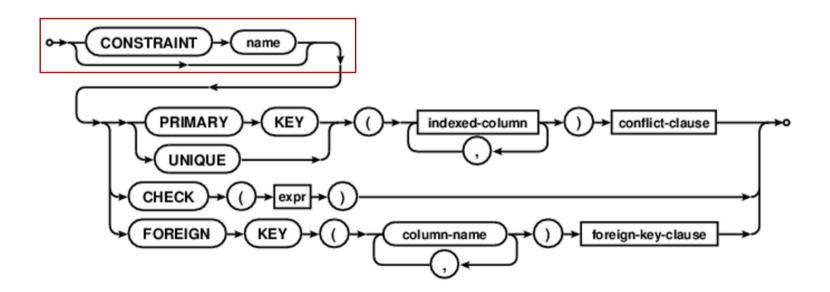

Must be enabled separately for each database connection

PRAGMA foreign\_keys = ON;

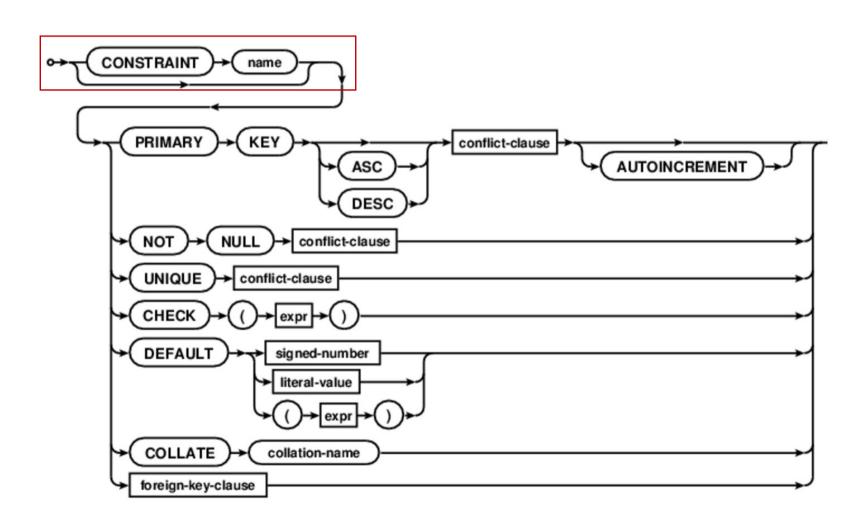

# Constraint Naming

Naming constraints is optional but is a good practice

It makes it easier to identify the constraints when errors occur and to refer to them

# Constraint Naming

```
SID INTEGER,

SName TEXT,

GPA REAL CONSTRAINT GPARange CHECK (GPA<=4.0),

SizeHS INTEGER CONSTRAINT maxSizeHS CHECK (sizeHS < 5000),

CONSTRAINT StudentPK PRIMARY KEY (SID)

);
```

### Assertions

Constraints on entire relation or entire database

Are in the SQL standard but are not supported by any database system

**CREATE ASSERTION** <assertion\_name> **CHECK** (<condition>);

# CREATE ASSERTION Key CHECK( (select count(distinct A) from T) = (select count(\*) from T))); CREATE ASSERTION ReferentialIntegrity CHECK( not exists (SELECT \* from Apply

CREATE ASSERTION AvgAccept CHECK(

3.0 < (select avg(GPA) from Student
 where sID in
 (select sID from Apply where decision = 'Y')));</pre>

where sID not in (select sID from Student)));

# Assertion checking

### CREATE ASSERTION AvgAccept CHECK(

3.0 < (select avg(GPA) from Student
where sID in
(select sID from Apply where decision = 'Y')));

Determine every possible change that could violate the assertion What changes are these in the above assertion?

Modifying a GPA, student ID and decision Inserting or deleting from students or apply

### After those modifications

check the constraint, make sure they it's still satisfied and, if not, generate an error and disallow the database change

### Kahoot time!

Any doubts?
